Goals 1) Identifying and
eradicating vulnerabilities 2)
Protecting against internal and
external threats 3) Ensuring

continuous availability

Mission to the Moon

Mission to the Moon is a 1943 American documentary film about the potential of rocket technology for space travel. The film was produced and directed by Douglas Edwards for New York World's Fair and distributed by Twentieth Century Fox. The film was the last to use the Movietone News footage montage technique. At the time of its release, the film was the

first to show the moon's surface clearly and in color. It was also the first to show the Soviet Union as a nuclear power, in the form of a rocket launch that took place earlier in the film. The film was the first to tell the story of the Soviet Union's first Sputnik success in its early form, and how its satellite changed world awareness about that country. Plot The film opens with the flight of the Soviet Union's first satellite,

called Sputnik 1, on October 4, 1957. Although it was a failure in that the satellite did not achieve orbit, the launch sent a shock wave around the world.

The story then turns to the Space Age in which the Soviet Union led the way in the field of space exploration, through the construction of the Soviet space station Mir and the first manned space flight of a cosmonaut, Yuri Gagarin, on April 12, 1961. The film ends with a

prediction for the future,
namely the construction of a
space station which would link
two earth orbits. Production The
film was a collaboration
between Twentieth Century Fox
and New York World's Fair.
After the World Fair, the film
was developed into an
educational slide and a 70mm
version. See also List of
