family manufactured by Apple Inc. Announced in September 1997, the PowerMac G5 was the first new model of Power Macintosh
to be announced since the introduction of the Quadra 800 in 1990. The PowerMac G5 was designed by Peter Skillman, with a fully
integrated motherboard and a 1GHz PowerPC 7300 processor. Features The PowerMac G5 is the first to feature a motherboard
fully integrated with the PowerPC processor, as in previous Power Macintosh models. The motherboard contains the logic for the
display controller, video, sound, keyboard, and PowerPC-native functions, such as cache control and processor state. The integrated
logic also means that the G5 uses a new 64-bit data bus, a new video display port, and a new IEEE 1394 FireWire port, all with
improved performance over previous models. The PowerMac G5's display uses a 1.3 megapixel True Color LED active matrix
display with 16.7 million color pixels. The display is approximately the same size as the Quadra 600's (12 inches), but is much
larger than 2d92ce491b
