This is a guide to all of the most commonly used Photo editing software available. It also explains why you need to do a lot of research before you start thinking about buying. Photodex Producer 4.2.0 review | Email this page to a friend. 100% Fast and free.

Q: Trouble understanding the specification of RSA I am trying to understand the following snippet from the book "Introduction to RSA Cryptography": You are given the public modulus $n = pq$ for the RSA cipher, and you need to determine the private exponent d such that $a^d \equiv g^{(n-1)} \pmod{n}$. It is not enough to know that $a \equiv g \pmod{n}$. I've looked at the answer in the book, but I am still confused as to why the author suggests that you solve $a^d \equiv g^{(n-1)} \pmod{n}$ by solving $a^d \equiv g \pmod{n}$ first. Why does that not work?

A: In standard RSA, the public exponent e is

typically chosen to be an integer $e \geq 1$, in which case $d = \frac{e \bmod \phi(n)}{e}$, where ϕ is the Euler totient function. In this case, you have two useful properties: $\bmod \phi(n)$ is an isomorphism between $\mathbb{Z}/n\mathbb{Z}$ and $\mathbb{Z}/\phi(n)\mathbb{Z}$, $\phi(n) \geq 1$. So, instead of knowing that $a \equiv g \pmod n$, you can find d from $a^d \equiv g^{\phi(n)} \pmod n$. // This file is part of Eigen, a lightweight C++ template library // for linear algebra. // // Copyright (C) 2009 Hauke Heibel // // This Source Code Form is subject to the terms of the Mozilla // Public License v. 2.0.
