The development of novel dosage forms has not kept pace with recent scientific advances in pharmaceutical sciences, particularly in relation to the physiological characteristics of drugs. The diversity of drug presentation to the body, which determines its pharmacokinetic profiles, is rising with the invention of newer dosage forms. The following section reviews some of the dosage forms that have been developed in recent years. Chapter 1.1 Introduction Download the eBook.Biopharmaceutics and Pharmacokinetics. Understanding the basic principles of drug absorption and metabolism, with emphasis on what the various drug delivery techniques can do to optimize them, is essential in the development of new drug delivery systems. The focus of this chapter is on the performance of drug delivery systems and on the capabilities of these systems in improving the pharmacokinetic characteristics of drugs administered via the oral route. : Over many years, three important observations have been made in relation to drug absorption. (1) Some drugs are readily absorbed (i.e., they are typically absorbed in more than 90% of the administered dose in less than 2 hr), and (2) some drugs are poorly absorbed or not absorbed at all (i.e., they are typically absorbed in less than 25% of the administered dose in 2 hr). Third, it is impossible to predict from the physicochemical properties of the drug and the characteristics of the dosage form the rate and extent of absorption in man in any given situation. The purpose of this chapter is to (a) provide the reader with a basic understanding of drug absorption, (b) review the various factors affecting absorption, (c) discuss various methods by which absorption is measured, (d) discuss pharmacokinetic parameters and terminology associated with the study of absorption, and (e) explain the
